JUMP START WORKSHOPS

See the process. Reimagine the possibilities.

How we use AIxRay in a Jump Start to understand how your work runs today and to design how it could run with supervised AI.

Sogeti Part of the Capgemini Group

EXECUTIVE SUMMARY

One shared view of a process turns AI ideas into decisions

Many AI conversations stall because nobody can point to where the work happens, who does it and what a change would be worth.

In a Jump Start, we put one of your processes under AIxRay and work through it with the people who run it. The same model carries the discussion from today's process to a future design and a first estimate of its value.

01 **Understand.** We build a model of today's process from your documents and the people in the room, then play real cases through it, exceptions included.

02 **Reimagine.** We design a future version, trying simpler fixes first and using supervised AI where it earns its place, with approvals and fallbacks written down.

03 **Evaluate.** We estimate cycle time, effort and cost from assumptions everyone can see and challenge, and agree what to validate next.

→ **You leave with** an agreed current-state model, a future-state design, a prioritized list of opportunities and a pilot brief with named owners.

WHY START WITH THE PROCESS

AI ideas need a real process to land in

Before deciding where AI fits, a leadership team needs the same picture of how work moves today. Three things usually get in the way.

Process knowledge sits with people

How work really moves, where it waits and how exceptions are handled often lives in people's heads and in documents that disagree with each other.

AI opportunities stay abstract

Without a shared view of the steps, it is hard to say where AI helps, where a simpler fix would do, and where people need to stay in control.

Business cases hide their assumptions

Benefit figures are hard to trust when nobody can see the volumes, effort and costs behind them, or which of those were measured and which were guessed.

THE TOOL

AIxRay is a workbench for process workshops

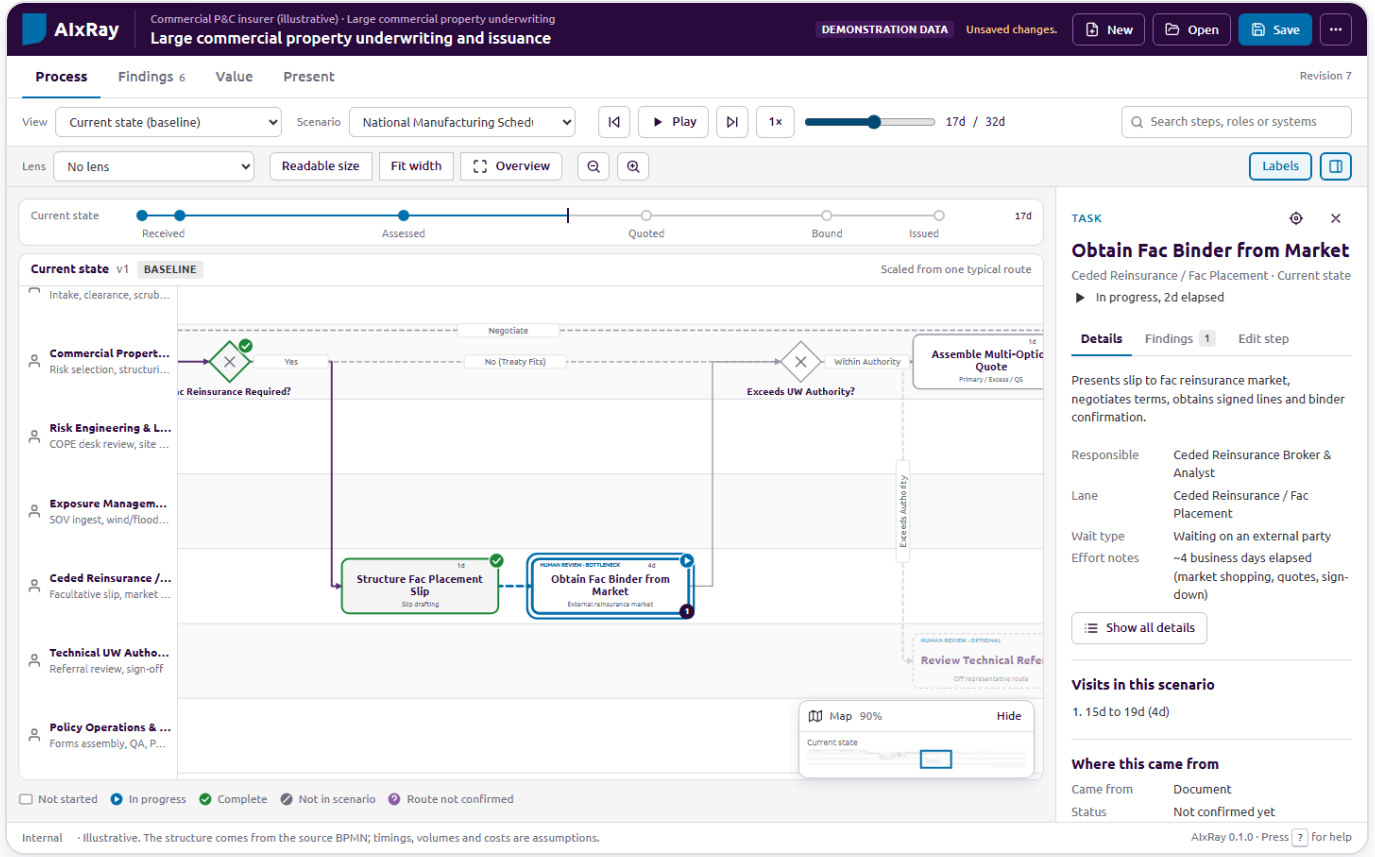

01 Plays a case through the process step by step, on one screen the whole room can follow.

02 Records pain points, questions and ideas on the step where they come up.

03 Compares today's process with a future design on the same clock.

04 Shows every figure with its formula and inputs, labeled by how much we know about them.

05 Runs in the browser from local files, with no server, account or installation.

Illustrative example: commercial property underwriting, demonstration data.

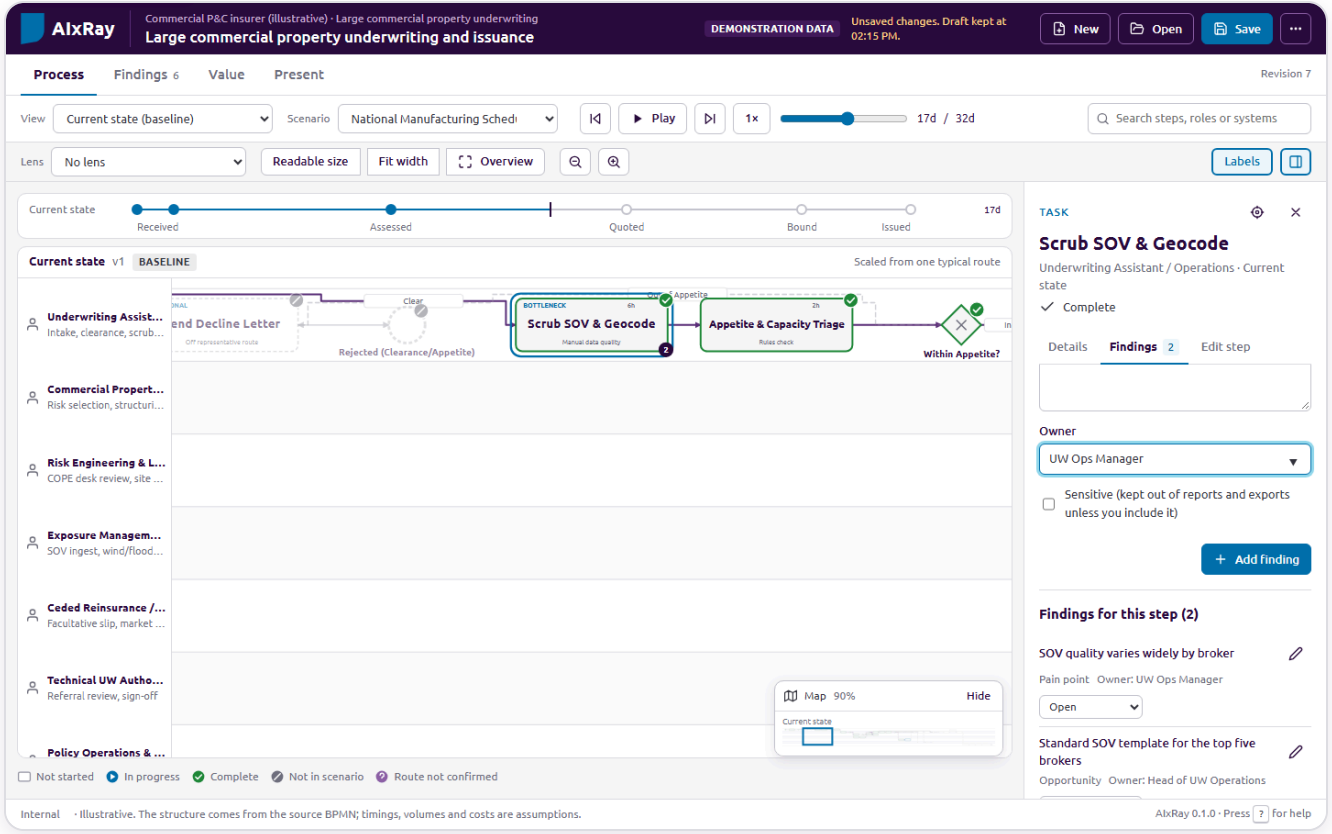

HOW AIXRAY FITS IN A JUMP START

One model carries the work from understanding to evaluation

The workshop runs as three conversations, understand, reimagine and evaluate, with preparation before and a clear hand-over after.

BEFORE	01	02	03	AFTER
Prepare	**Understand**	**Reimagine**	**Evaluate**	**Hand over**
We gather your procedures, maps and notes, plus a system event log where one exists, and draft a first model of the process.	We walk routine cases and exceptions with the people who do the work, correct the model live and capture findings at each step.	We try removing, simplifying and connecting steps before adding automation and AI, and design the controls for each AI step.	We model cycle time, effort and cost against today's baseline, see which assumptions matter most and rank the opportunities.	We agree a checkpoint, produce the pilot brief and report, and send a review form to stakeholders who were not in the room.
ON SCREEN IN AIXRAY				
AI-drafted model, reviewed by our team	Walkthrough and findings at each step	Future alternatives and automation designs	Value, sensitivity, matrix and waves	Pilot brief, report, review form and exports

Agree how the work runs today

Findings recorded on the step they belong to. Illustrative example, demonstration data.

A **Start from what you have.** Procedures, process maps, slides, notes or BPMN files. AI can draft the first model; our team reviews it before you see it.

B **Walk the routes.** The routine case first, then the exceptions, choosing each branch with the participants.

C **Capture at the step.** Pain points, open questions and decisions are recorded where they arise, each with an owner.

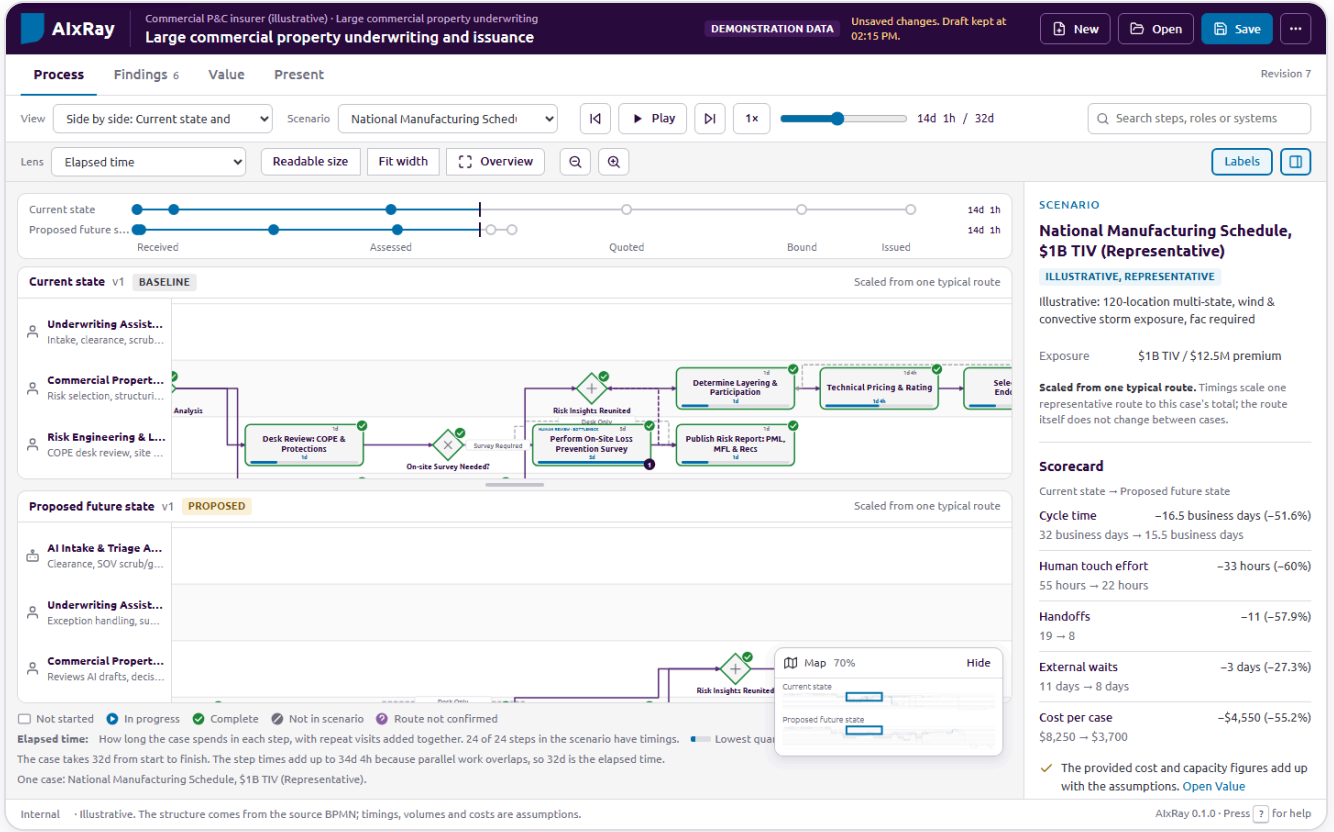

D **Keep evidence apart from belief.** Each step shows where it came from and whether you have confirmed it.

Design the future process against a locked baseline

A **Simpler changes first.** Each opportunity asks whether removing, simplifying, standardizing or connecting systems would do the job before automation or AI.

B **A baseline that cannot drift.** Today's process is locked. Every future alternative records which steps changed, were added or removed, and why.

C **Side by side, on one clock.** Both versions play together, so the room sees where time, handoffs and waits fall away.

Current and proposed future state with the scorecard. Illustrative example, demonstration data.

Every AI step is designed with its controls

For each step where automation or AI does the work, we write down how it is supervised before it goes anywhere near a pilot.

Approvals, permissions, escalation and test criteria stay attached to the design and flow into the pilot brief and its acceptance criteria.

People keep the decisions that need judgment.

DESIGN ELEMENT	EXAMPLE: AI CHECKS APPLICATION COMPLETENESS
Trigger	Application received
Rules and limits	Check required fields only. Do not approve applications.
Approval	Case handler approves every external message.
Fallback and escalation	Return to manual intake when extraction fails. Escalate uncertain cases to the duty manager.
Test criteria	Flag every missing required document in the agreed test set.
Owner	Operations lead

Illustrative example from a synthetic workshop.

Directional estimates you can check line by line

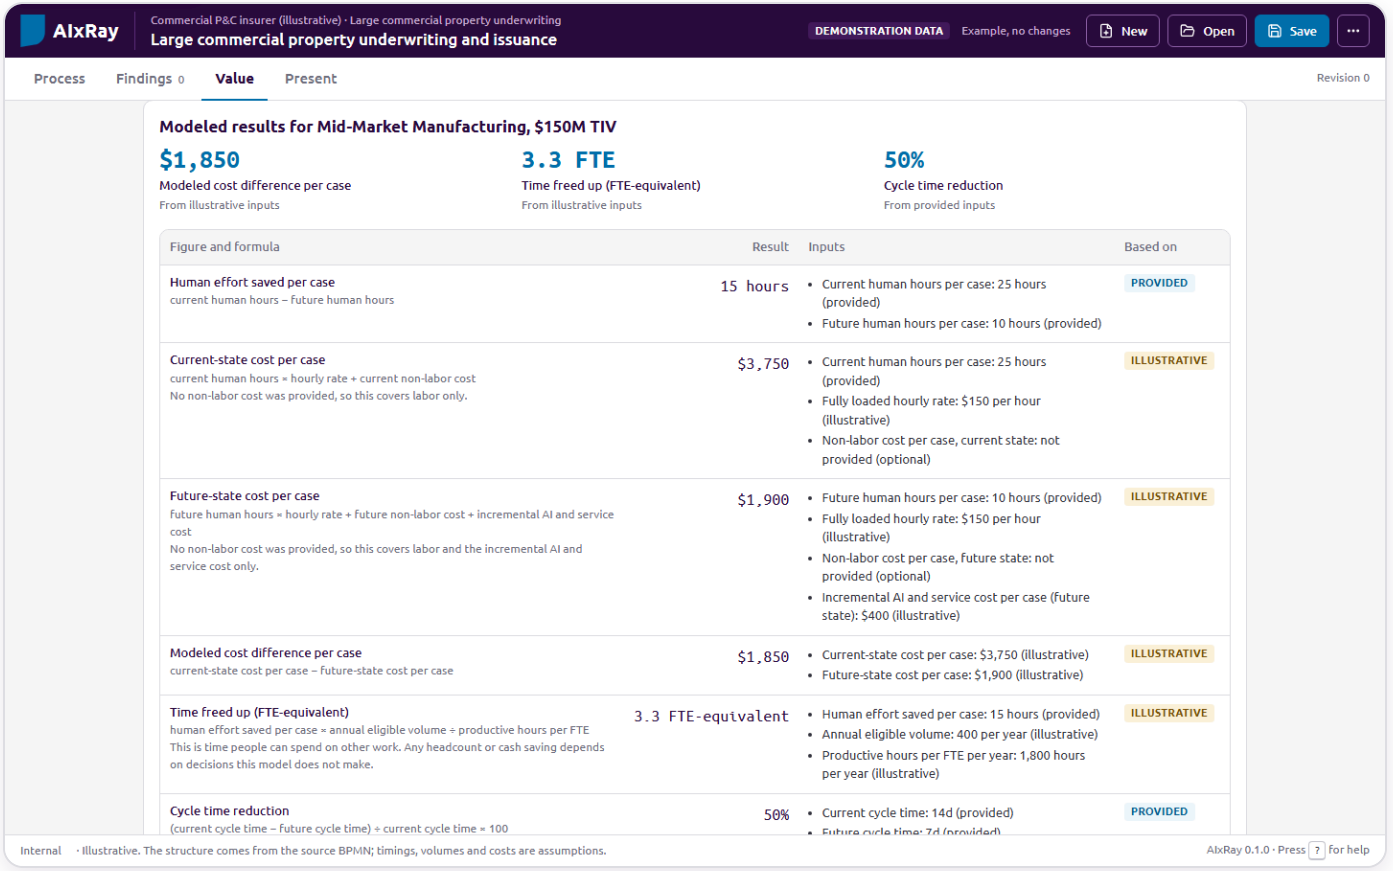

Cycle time
Start to finish, waits included

Human effort
Hands-on hours per case

Operating cost
Labor plus AI and service cost

Freed capacity
Time released, in FTE

- Every figure shows its formula and inputs. Each input is labeled illustrative, provided, measured or confirmed.
- A missing input leaves the result blank rather than assuming zero.
- A sensitivity view shows which inputs move the result most, which tells us what to validate first.

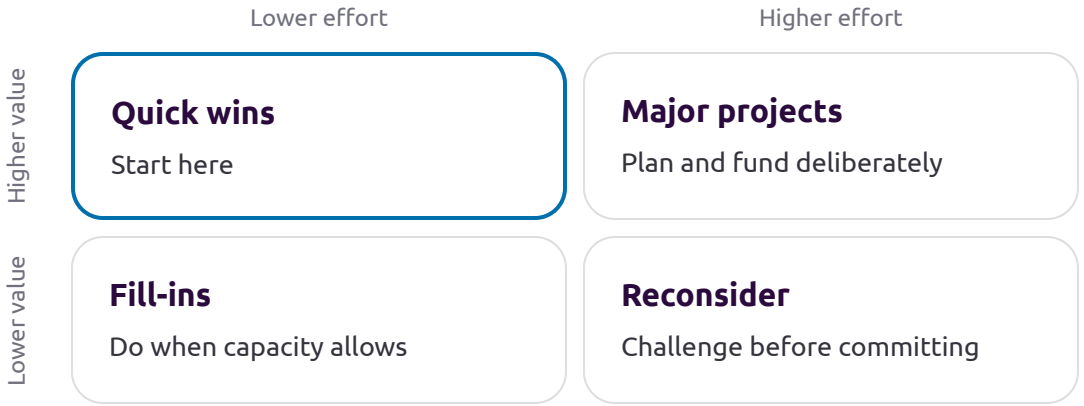

Figures are directional estimates for decision-making, not guaranteed results. Illustrative example, demonstration data.

From a list of findings to a plan in waves

Each opportunity carries a small business case: effort saved, cases affected and cost to deliver. That lets us compare them on the same terms.

Value against effort

Delivery waves

Now	Quick wins and the first supervised AI pilot, with acceptance criteria and owners.
Next	Changes that depend on the pilot's results or on connecting systems.
Later	Larger redesigns, kept visible with their open questions.

Each wave shows a running total of its modeled value, built from the same formulas as the individual opportunities.

BEYOND THE WORKSHOP

Add measured data when you have it

Workshop estimates are a starting point. If your workflow, ticketing or core system can export an event log, the same model can show how the process actually runs.

Measure today's process

How many cases reach each step, how long each step takes and which paths cases follow, shown next to what the workshop captured.

Check whether a change worked

A log from before a change and one from after are compared step by step, with caveats such as seasonality and volume mix stated alongside.

Only aggregates are kept

Counts and times per step. Individual events, case IDs and the names of people in the log are not stored.

OUTCOMES

What you take away from the Jump Start

01

Current-state model

Agreed with the people who run the process, with its sources and open questions.

02

Future-state design

One or more alternatives compared with the baseline, each change with its reason.

03

Prioritized opportunities

Ranked by value against effort and grouped into now, next and later.

04

Pilot brief

Automation designs with their controls, acceptance criteria and owned actions.

05

Report and review form

A printable summary, and a form that lets stakeholders confirm or dispute each step.

06

Exports for your tools

A PowerPoint deck, a BPMN 2.0 diagram, and a Jira, Azure DevOps or Excel backlog.

DATA HANDLING

Your material stays under your control

Runs from local files

Opened from disk, AIxRay makes no network requests. The saved project file is the record, stored like any other client document.

AI drafting is optional and labeled

AI runs only on approved commercial plans with the project lead's approval. Every AI draft stays out of reports and exports until a person reviews it.

Sensitive findings stay out by default

Findings marked sensitive are left out of reports, review forms and exports unless someone deliberately includes them.

Review forms carry only what you choose

Steps and selected findings, with no figures, sources or notes. The form sends nothing anywhere; answers come back as a file.

Where material includes personal or otherwise regulated data, we agree the handling with your data protection officer before the workshop.

What we ask of you before the workshop

01 **A candidate process** with a clear start, a clear end and a business owner who wants it improved.

02 **The right people in the room:** those who run the work day to day, and a decision maker for the checkpoint.

03 **The evidence you already have:** procedures, process maps, slides, notes or BPMN files, and a system event log if one is available.

04 **Rough figures:** volumes, effort, waiting times and costs. Estimates are fine; we label them as assumptions and test which ones matter.

NEXT STEPS

Which process should we put under the AIxRay?

Turn an AI conversation into a concrete process-transformation discussion.

01 **Choose a candidate process** together, based on volume, pain and appetite for change.

02 **Confirm participants and dates** for the Jump Start sessions.

03 **Share the material you have** so we can prepare a first model before we meet.
